

Barcode-Based ERP System

Procurement Module

The Procurement Module manages the purchasing process of clothes from suppliers. The workflow begins when the Procurement Officer creates a Purchase Order (PO) for required products. Items can be added to the PO either by scanning the product barcode or by manually selecting them from the product list. After selecting products, the officer enters the purchase quantities and reviews the order details. Once verified, the PO is submitted for approval and then sent to the supplier. After the supplier delivers the goods, the Procurement Officer records the supplier bill in the system. This invoice is generated based on the validated Goods Receipt Note (GRN), ensuring only received items are billed.

Functional Requirement

- Add, edit, delete and view suppliers
- Create purchase order
- Add products to PO via barcode scan or manual selection
- Enter purchase quantities
- Approve Purchase Orders
- View purchase history

Inventory Module

The Inventory Module is operated mainly by the Store Keeper and handles all stock-related activities. Once goods arrive from the supplier, the Store Keeper performs the Goods Receipt Note (GRN) by scanning each product's barcode to validate received quantities. After successful validation, stock levels are automatically updated in the system. The Store Keeper then manages internal stock operations such as transferring items between locations, performing inventory adjustments for damaged or missing products, and monitoring stock availability. Inventory is maintained by size and brand to support clothing shop requirements. The Store Keeper can also generate stock reports and review stock history to ensure accurate inventory control.

Functional Requirement

- Add and edit product details

- Scan barcode to receive goods
- Validate GRN
- Automatic stock updates
- Stock transfer between locations
- Inventory adjustments
- View stock levels
- View stock history
- Generate stock reports

POS Module (Point of Sale)

The POS Module manages customer sales transactions. The workflow starts when the Cashier scans the barcode of clothes selected by the customer. The system automatically fetches product information such as name, price, size, and brand. The cashier selects quantities and applies discounts if applicable. The system calculates the total amount automatically, and payment is collected via cash or card. After completing the transaction, a sales receipt is generated. The sold quantities are immediately deducted from inventory in real time. If customers return items, the cashier processes returns through the POS system, and stock levels are adjusted accordingly. Daily sales closing is performed at the end of each business day.

Functional Requirement

- Scan product barcode
- Auto-fetch product details
- Select quantities
- Automatic total calculation
- Apply discounts
- Accept cash and card payments
- Generate payment receipt
- Handle product returns
